

e-SolarForecast™
Online Solar Power Forecasting Service

e-SolarForecast™ is an online solar generation forecast service for utility-scale solar farms and the CAISO market. Our forecasts are provided for a horizon extending to seven days with hourly resolution. The forecasting engine consists of an ensemble of intelligent system based models that employ several different state-of-the-art adaptive machine learning models. These capture the non-linear and complex relationship between the generated power and its driving factors such as solar irradiance, temperature, wind speed, number of operational panels, and more. The required irradiance and weather data are provided by major weather data vendors and are continuously updated in real-time. You can access forecasts via web posting, API, FTP and Excel®. Our experienced experts continuously monitor model performance, ensuring the most accurate and reliable data at all times.

Features

- ✓ Forecast horizon extending to 7 days out
- ✓ Hourly update of forecasts
- ✓ Access via Interactive Web and Excel® Interfaces
- ✓ APIs for automated download of forecasts
- ✓ Downloadable versions in a variety of formats
- ✓ Continuous monitoring of forecast accuracy and model calibration
